### 10-14: Product of Quotient Rules

Last week, we introduced the **derivative function**  $f'(x)$  of a function  $f(x)$ , whose evaluation  $f'(a)$  at the point  $x = a$  is given by:

- the slope of the tangent line at  $x = a$
- the instantaneous velocity at time  $x = a$

On Monday, we covered algorithms to help us compute the derivatives of polynomials and exponential functions. Today, we'll tackle **products** and **quotients**

**Theorem (Product Rule).** If  $f(x)$  and  $g(x)$  are differentiable functions, then so is their product  $f(x) \cdot g(x)$ . The derivative of the product is given by

$$\frac{d}{dx}(f(x) \cdot g(x)) = f'(x) \cdot g(x) + f(x) \cdot g'(x).$$

**Example 1 (Warning).** The derivative of a product is **not** equal to the product of the derivatives: Consider the product  $x \cdot x$ . Then

$$\frac{d}{dx}(x) \cdot \frac{d}{dx}(x) = 1 \cdot 1 = 1$$

but instead

$$\frac{d}{dx}(x \cdot x) = \frac{d}{dx}(x) \cdot x + x \cdot \frac{d}{dx}(x) = 1 \cdot x + x \cdot 1 = 2x$$

which is what the **power rule** gives us for the derivative of  $x \cdot x = x^2$ .

**Exercise 1.** Use the Product Rule to find  $f'(x)$  when  $f(x) = (3x^2 + 1)e^x$ . Simplify your answer.

$$\begin{aligned} \frac{d}{dx} \left[ (3x^2 + 1) \cdot (e^x) \right] &= \frac{d}{dx} (3x^2 + 1) \cdot (e^x) + (3x^2 + 1) \cdot \frac{d}{dx} (e^x) \\ &= (6x)(e^x) + (3x^2 + 1)(e^x) = \boxed{(3x^2 + 6x + 1)(e^x)} \end{aligned}$$

**Theorem (Quotient Rule).** If  $f(x)$  and  $g(x)$  are differentiable functions, then so is their quotient  $f(x)/g(x)$  whenever  $g(x) \neq 0$ . The derivative of the quotient is given by

$$\frac{d}{dx} \left( \frac{f(x)}{g(x)} \right) = \frac{f'(x)g(x) - f(x)g'(x)}{(g(x))^2}.$$

**Remark 2.** The Quotient Rule can be derived from the product rule: Letting  $Q(x) = \frac{f(x)}{g(x)}$ , cross multiply the equation and differentiate both sides with respect to  $x$  using the Product Rule. Solving for  $Q'(x)$  leads to the above formula.

**Exercise 2.** Use the Quotient Rule to calculate the derivative of  $\frac{1}{x^4}$  and check your answer against the result obtained from using the Power Rule.

$$\cdot \text{top} = 1, \quad \frac{d}{dx}(\text{top}) = 0$$

$$\cdot \text{bottom} = x^4, \quad \frac{d}{dx}(\text{bottom}) = 4x^3$$

$$\frac{d}{dx}\left(\frac{1}{x^4}\right) = \frac{\frac{d}{dx}(\text{top}) \cdot \text{bottom} - \text{top} \cdot \frac{d}{dx}(\text{bottom})}{(\text{bottom})^2} = \frac{0 \cdot x^4 - 1 \cdot 4x^3}{(x^4)^2}$$

$$= \frac{-4x^3}{x^8} = \boxed{-\frac{4}{x^5}} \quad \frac{d}{dx}(x^{-4}) = \boxed{-4x^{-5}}$$

← equal! →

**Exercise 3.** If  $g(x) = \frac{3x+1}{2x-5}$ , find and simplify  $g'(x)$ .

$$g'(x) = \frac{\frac{d}{dx}(3x+1)(2x-5) - (3x+1) \cdot \frac{d}{dx}(2x-5)}{(2x-5)^2}$$

$$= \frac{(3)(2x-5) - (3x+1)(2)}{(2x-5)^2} = \frac{6x-15-6x-2}{(2x-5)^2} = \boxed{\frac{-17}{(2x-5)^2}}$$

**Exercise 4.** If  $h(x) = \frac{e^x}{x^2+1}$ , find and simplify  $h'(x)$ .

$$h'(x) = \frac{\frac{d}{dx}(e^x)(x^2+1) - (e^x) \cdot \frac{d}{dx}(x^2+1)}{(x^2+1)^2} = \frac{e^x(x^2+1) - e^x(2x)}{(x^2+1)^2}$$

$$= \boxed{\frac{e^x(x^2-2x+1)}{(x^2+1)^2}}$$

**Exercise 5.** Suppose that  $f(3) = 5$ ,  $f'(3) = -7$ ,  $g(3) = 2$ , and  $g'(3) = 1/2$ . If  $H(x) = \frac{f(x)}{xg(x)}$ , find  $H'(3)$ .

$$H'(x) = \frac{f'(x) \cdot [x \cdot g(x)] - f(x) \cdot \frac{d}{dx}[x \cdot g(x)]}{(x \cdot g(x))^2}$$

$$= \frac{f'(x) \cdot g(x) \cdot x - f(x)(2 \cdot g(x) + x \cdot g'(x))}{(x \cdot g(x))^2}$$

$$\frac{(-7)(2)(3) - (5)(2 + 3 \cdot \frac{1}{2})}{(3 \cdot 2)^2} = \boxed{\frac{-119}{72}}$$

$$H'(3) = \frac{f'(3) \cdot g(3) \cdot 3 - f(3)(2 \cdot g(3) + (3) \cdot g'(3))}{(3 \cdot g(3))^2} = \frac{(-7)(2)(3) - (5)(2 + 3 \cdot \frac{1}{2})}{(3 \cdot 2)^2}$$
